Summary

Software engineer with ~3 years of experience designing backend systems and debugging complex production environments. Worked on payment and reporting platforms processing 1,000+ daily transactions (up to 25K peak) across 10K users. Known for resolving production issues and improving system reliability.

Professional Experience

Healthsoft

NS, Canada

January 2025 – July 2025

Software Engineer II

- Migrated report generation from a traditional server to **AWS Lambda**, cutting peak-time processing latency from **35–40 s** to **2–3 s** and enabling on-demand scalability.
- Took ownership of the **entire CI/CD pipeline**, automating manual file updates (a **6–7 hour manual task**) and testing to near zero human effort, enabling reliable bi-weekly deployments after each sprint.
- Replaced 10-second polling with **webhook-based integrations**, eliminating 8,000+ unnecessary database calls per day and enabling real-time event processing.
- Automated **payment processing** and error handling, eliminating **~\$40/day** in human-error losses and preventing up to **\$3K in missed revenue** on peak days by tightening validation and retry logic.
- Implemented a **Redis-backed rate-limiting** layer for 6-digit login tokens, allowing only 100 retries per hour per user and automatically blocking offending IPs.

Trimax Infotech

NS, Canada

April 2024 – December 2024

Full Stack Developer (Project Lead)

- Introduced branch protection, linting, and mandatory pull-request approvals across a **50K-line frontend and backend codebase**, stabilizing biweekly production releases.
- Led a **team of 5 developers**, coordinating delivery of backend and frontend across **3 client deployments**.
- Optimized high-frequency transaction queries and redesigned multiple MySQL and PostgreSQL tables, improving performance of core application workflows processing on thousands of records.

Healthsoft

GJ, India

May 2022 – November 2023

Software Engineer

- Designed an **OAuth2-based integration layer** for a monolithic platform, exposing **37 secure API endpoints** and enabling **10+ external client systems** to build independent frontends while relying on core business logic.
- Implemented token-based authentication (access and refresh tokens) with **RBAC-backed permission scopes**, defining **5 permission tiers** and API rate limiting, securing external system access to internal services.
- Integrated terminal-machine payment processing supporting **50+ in-person transactions daily**, eliminating manual entry errors and **preventing ~\$2K annual revenue loss**.
- Automated generation of daily operational reports for finance and operations teams, **eliminating ~3 hours of preparation** each day.

Imbuesoft LLP

GJ, India

January 2022 – April 2022

ReactJS Developer Intern

- Built interactive reporting **dashboards using Chart.js**, visualizing pharmacy sales and patient data through 5+ data-driven charts powered by REST APIs.

Education

Dalhousie University

September 2023 – April 2025

MSc. in Applied Computer Science

3.89/4.3 CGPA

Skills

Programming Languages: Python, JavaScript, TypeScript, SQL

Technologies: React, Next.js, Django, Flask, FastAPI, MySQL, AWS, Git, Docker, Jenkins

Personal/Academic Projects

Serverless Image Processing Pipeline | **AWS Lambda, S3, Step Functions, API Gateway**

April 2023

- Designed an event-driven image processing pipeline where uploads through API Gateway trigger S3 events that invoke AWS Lambda functions orchestrated by Step Functions.
- Provisioned the complete infrastructure using CloudFormation (IaC), enabling reproducible deployments.
